FileBound 7 Introduces Enhanced UI, Workflow, e-Forms and Analytics

Latest release of Upland Software's Document and Workflow Automation application focuses on user experience to help make organizations more efficient

(Lincoln, NE) May 20, 2014– Upland Software, Inc., announced today the latest version of the FileBound product, a leading application of cloud-native document and workflow automation software and part of the Upland Software family of cloud-based Enterprise Work Management applications. FileBound 7 continues the product's tradition of delivering capability without complexity by offering enhanced capabilities while improving the overall user experience.

"Our customers are telling us they need better tools to increase efficiency, but they struggle with the complexity of legacy ECM [enterprise content management] applications," says Sean Nathaniel, Senior VP of Technology at Upland and General Manager at FileBound. "By taking our analytics, workflow and electronic forms capability to the next level in the cloud, FileBound 7 improves the way work gets done. Our refreshed user interface and focus on customer experience make it easier to complete work and respond quickly when business needs change."

FileBound 7's updated interface reflects the way people use consumer Web applications while maintaining a layout familiar to current users. It incorporates the common design standards Upland is applying across its family of products to deliver a consistent user experience across all of Upland's applications. The design of the new look is focused on ease of use, faster navigation, reducing clutter and bringing focus to the relevant and most important content.

Other enhancements to FileBound 7 include:

- New Workflow functionality that provides even greater flexibility in configuring and testing workflow in the graphical drag-and-drop interface. This gives users greater control and lets them respond to changing business needs quickly.
- A new Forms Portal, which includes a drag-and-drop E-form Designer that lets users create forms directly in FileBound in a matter of minutes. The Portal extends business processes outside of the four walls of the enterprise by allowing anyone anywhere to complete forms that can collect additional documentation and signatures.
- A new Android app, complementing the current iOS app, and an overall responsive design that allows FileBound to be device agnostic. Workers at organizations with BYOD policies and remote workers can have access to the same FileBound system at no additional cost over traditional access.

- Analytics enhancements that provide meaningful, timely and actionable business insights into all work processes. This allows business owners to get the full value of the data in FileBound to make better business decisions.

More information about FileBound 7 is available on the FileBound website at www.filebound.com/FB7, including registration for a virtual tour.

About FileBound
FileBound delivers cloud-native business process automation and document management applications that improve the operation of any organization by connecting users with the information they need to work more efficiently and effectively.
